

STE with R4i Writer

connect. create. validate.

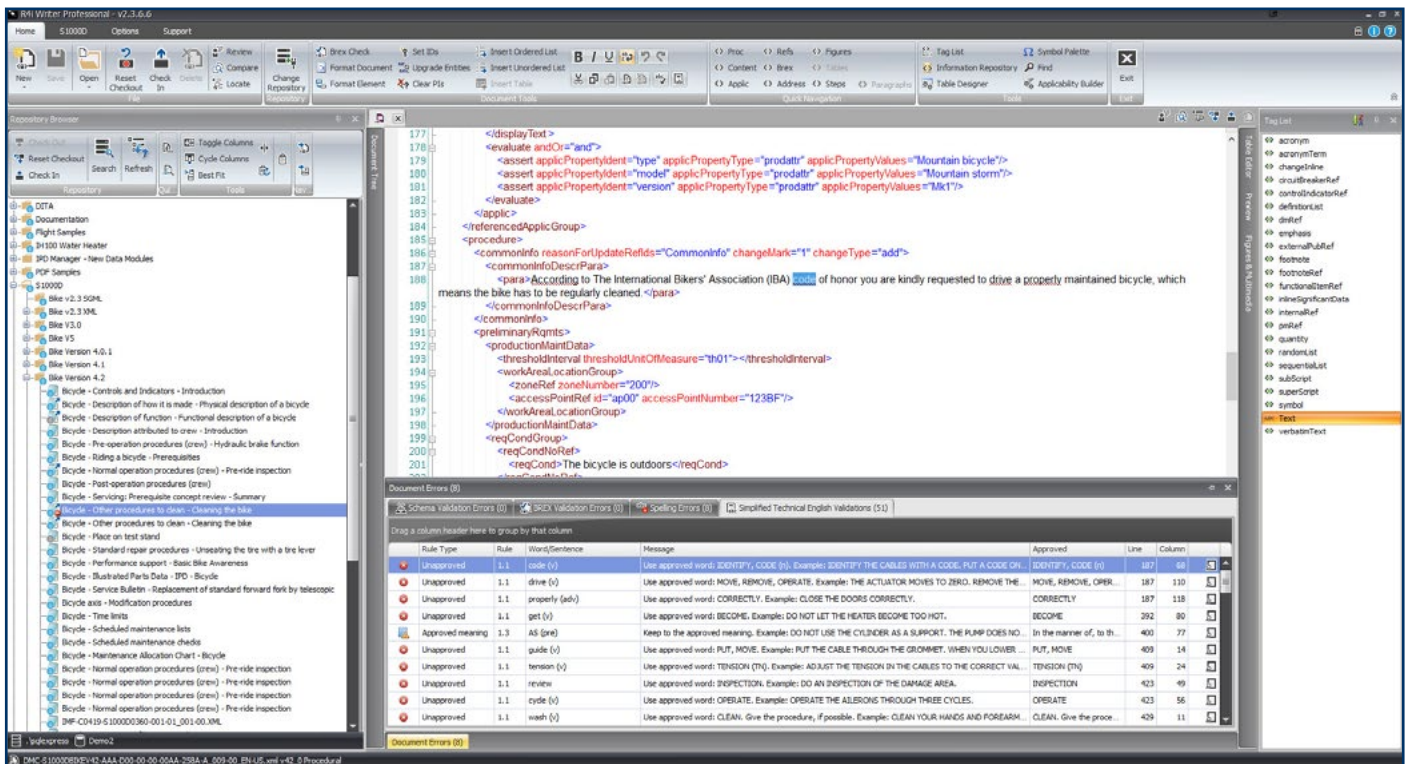

R4i Writer is the most advanced XML Authoring Tool for Technical Writers required to create mission critical content. The optional Simplified Technical English (STE) Module enables authors to easily comply with the ASD-STE100 International Specification.

Validate S1000D data modules directly within R4i Writer accessing project specific and STE Dictionaries.

The Simplified Technical English (STE) Specification is implemented when technical content needs to be easily understood by readers. STE removes the ambiguity of written technical procedures and ensures consistency in writing style while reducing the cost of re-usability and translation which includes an information check for the “correct use of approved words”.

- The built-in STE Assistant guides authors on the correct use of Technical English via an interactive view.
- Authors can check they are writing to the contracted project and STE requirements.
- An interactive view is provided for STE validation errors versus informational notifications, enabling authors to easily conform to STE Rules.
- Easily import project dictionaries from spreadsheets.
- Dictionary selection support allows users to validate to a specific project dictionary.
